

Feilong: the open source API for z/VM automation

VM Workshop - Columbus

June 23, 2023

What is Feilong?

- The Mandarin “Fēilóng or 飞龙” translates to "flying dragon"¹
- Winged legendary creature that flies among clouds in Chinese mythology²

¹ <https://translate.google.com/#view=home&op=translate&sl=zh-CN&tl=en&text=飞龙>

² <https://en.wikipedia.org/wiki/Feilong>

Mission of the project

- Contribute and further develop the RESTful API server that simplifies interaction with the IBM z/VM hypervisor.

Community Benefits

- Presents a de-facto RESTful API standard for z/VM interaction.
- Have a strong codebase to use, contribute and further develop thanks to the IBM contribution to the project.
- The RESTful API server makes using z/VM easier especially for developers without deep knowledge of z/VM.
- Enable development of self-service Infrastructure-as-a-Service automation of VMs, networking and storage used by z/VM.

Project Information

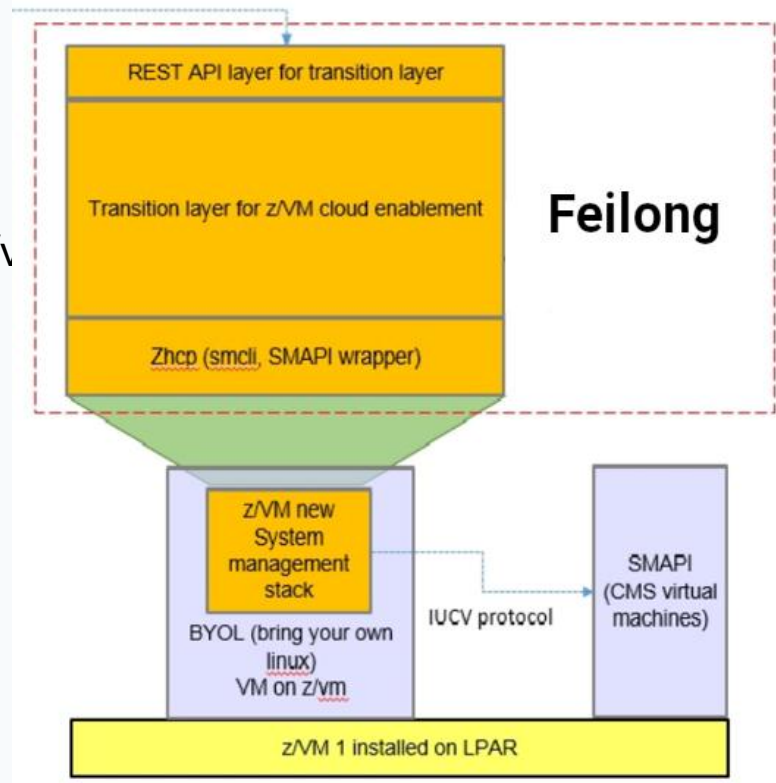

- Home - <https://www.openmainframeproject.org/projects/feilong>
- Github - <https://github.com/openmainframeproject/feilong>
- Documentation - <https://cloudlib4zvm.readthedocs.io/en/latest/index.html>
- z/VM environment available for project contributions
- Monthly hour-long meeting on the second Wednesday of the month
 - Supporting global community
 - Odd months in US morning (9:00am EDT) and even months in US evening (9:00pm EDT)
- Meeting notes
 - Posted to Feilong project mailing list
- Staying connected
 - Mailing list

Project Highlights

- 60 GitHub forks with 42 contributors and 30 stars
 - 104 commits merged in 2022
 - Used within an IBM product as well as deployed within organizations
- January 2023 monthly meeting demonstrated setup and use of Feilong
- Average of 5 people attend monthly meeting
- Planned events in 2023
 - VM Workshop in June
 - IBM TechXchange in September
 - Open Source in Finance Forum in November

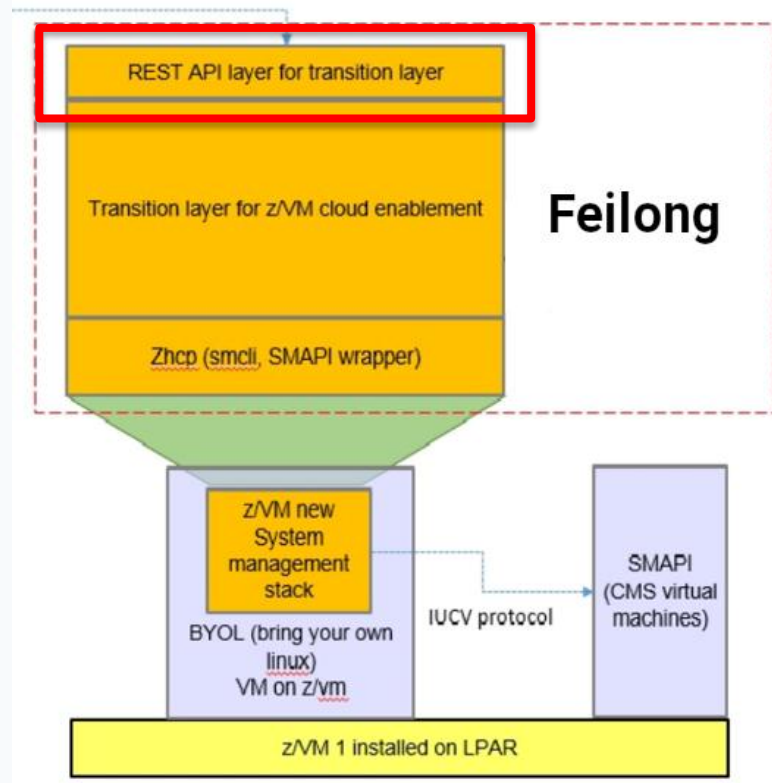

Overall architecture

- REST API Layer
 - Python based
 - REST API
 - Consumed by OpenStack, VMware vRA/v
- Transition Layer
 - Python based
 - Multiple thread
 - Called by REST layer
- Smcli (Zhcp layer)
 - Written in C
 - Call SMAPI

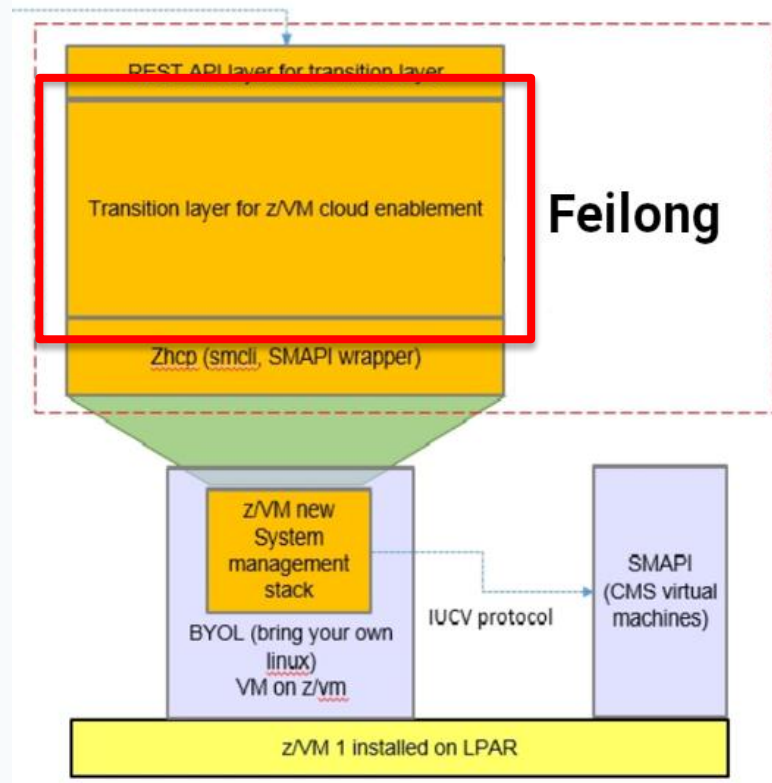

REST API layer

- Accept request from http client
- REST API
 - Example: create a guest
 - POST /servers/abc
- Managed by httpd or nginx services
- Easy to extend
- API backward compatible

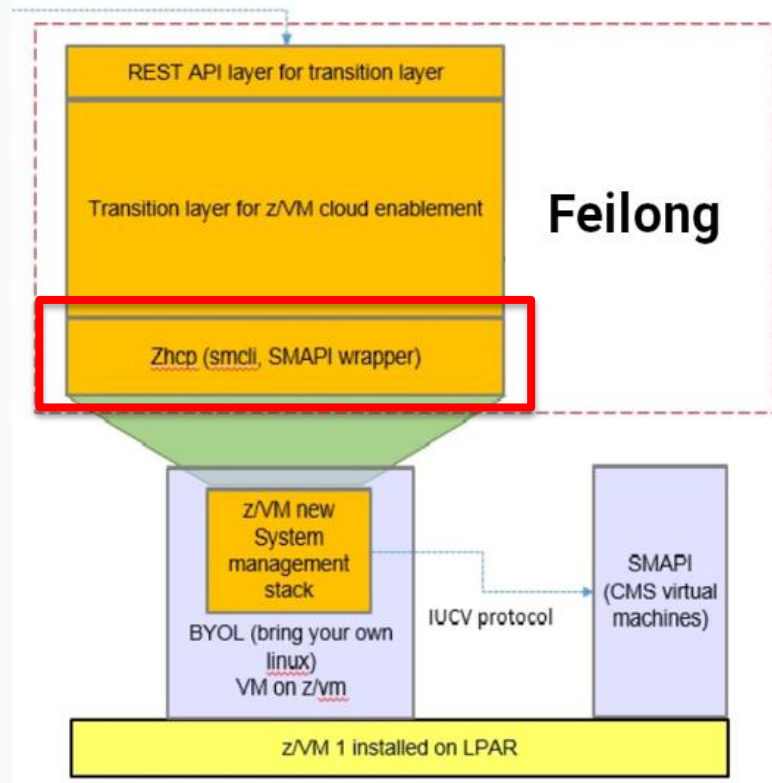

Transition layer

- Accept request from REST API layer
- Handle logic processing
 - Image
 - Vswitch
 - Host (z/VM)
 - Virtual machines
- Call SMAPI through zhcp layer

Zhcp layer

- Accept request from transition layer
- C based wrapper of SMAPI
- Handle requests like
 - Time out
 - Async ID
 - Error from SMAPI

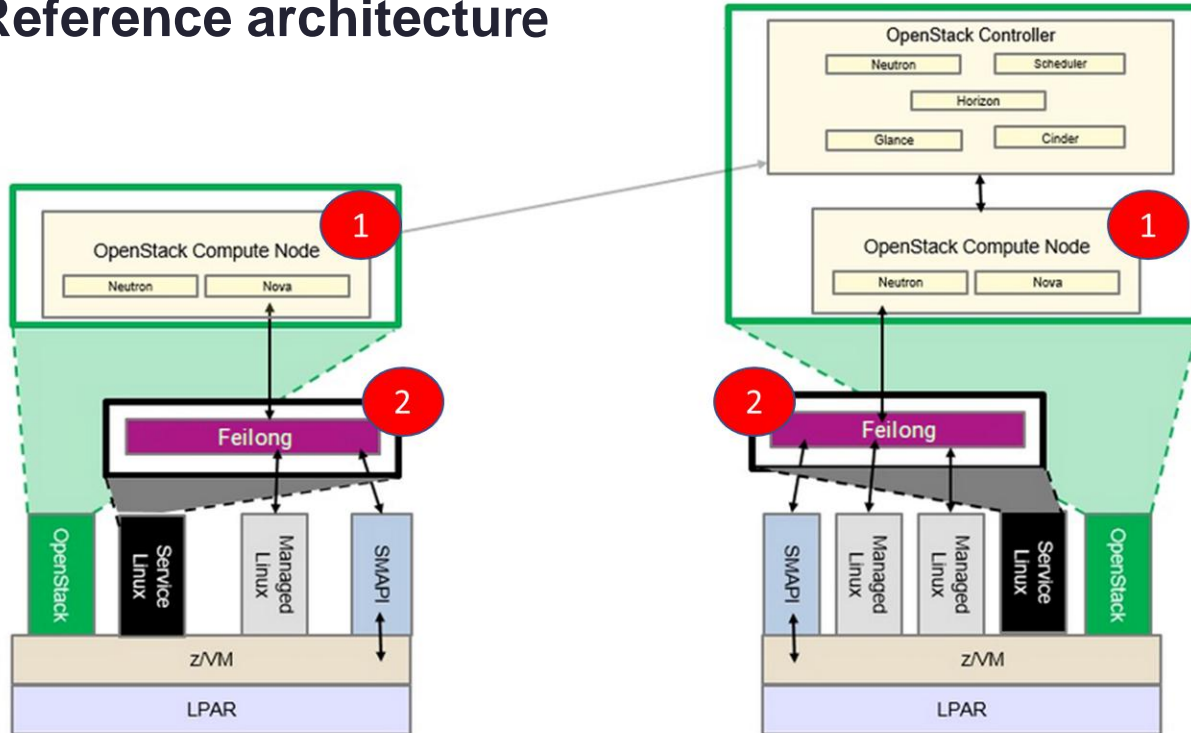

DEMO

*Using the RESTful API to interact with
z/VM (6:08)*

Reference architecture

- 1** Openstack (includes z/VM plugin)
- 2** Feilong

DEMO

*IBM Cloud Infrastructure Center using
Feilong to interact with z/VM (3:55)*

What's next for the project

- Graduate from Incubation to Active status
- Project contributions
 - Update documentation
 - New feature testing
- Sponsor an OMP summer mentorship project related to Feilong
- Increase the Feilong membership and regularly scheduled project meeting attendance

Thank you!
